

POTATOES & POTASSIUM

SIZE UP YOUR POTATO
CROP WITH KEY
NUTRITION FROM

CELL POWER®
K25 2-0-25

The requirement for potassium in potato production is higher than in any other commercial crop. As potatoes begin tuber bulking, optimal soluble potassium levels are critical to quality production. Potassium plays an important role during tuber bulking by encouraging starch production and movement of sugars from the leaves to the tuber. Potassium can also play a role in efficient water use when soluble. This is particularly important if soils become dry during the summer growing season. Cell Power® K25 provides potato growers a quality soluble potassium ready to meet the demands of your crop.
