

Cell Power® CytOmex 0-0-1 Transplanting

Building Foundations

Cell Power® CytOmex 0-0-1 is a 3-way seaweed extracted blend serving as a natural supplement with a variety of benefits containing natural cytokinins for increased root growth, betaines for environmental stress management, trace elements, antioxidants, plant defense elicitors and a well rounded balance of nutrition. Preparing vegetable transplants for planting into the field is a delicate process requiring necessary water and nutrients to the flats of plants and stimulating continued root development is critical. Properly hardening the young plants will increase the survival rate while insuring strong and healthy transplants.

Analysis & Tips

Developing stronger roots while still in the plug trays, provides small transplants a better chance of making it through transplanting and early spring stresses.

Healthy top growth needs a strong root system to support it. Cell Power® CytOmex 0-0-1 should be a vital component of your pre-planting preparation of transplants in flats (commonly referred to as "hardening off") before moving the transplants out of the greenhouse.

Timings and Rates

Cell Power® CytOmex 0-0-1 at 2 ounces per gallon of irrigation water, utilized in the final 2 waterings prior to transplanting provides the nutritional and hormonal balance to young plants that have been growing and confined to plastic or fiber cells. These plants are quite frequently root bound in their growing environment and need additional stimulus to break free of that environment and grow.
