

Cell Power Indra: For improved growth and quality of stressed crops.

What it does:

Cell Power® Indra is a product that improves growth and quality of crops by helping them cope with stress caused by heat, cold, salinity, drought and high UV light.

Stress causes crops to produce toxins (ROS) that damage cells and reduce quality. Indra promotes the plant's own antioxidant production and supplies the nutrients needed to make their manufacture possible. Indra can help protect crops from loss of quality and yield, improve color, and reduce susceptibility to disease.

OPPORTUNITIES

Drought and salinity protection:

Indra is proven to improve growth of crops during drought periods and where irrigation water has high salt content.

Heat and cold protection:

Indra helps plants grow better during periods of high and low temperatures. Priming allows them to cope when the weather gets tough, Indra helps farmers to safeguard yields and quality.

Reducing disease susceptibility:

Stress weakens plant cells and increases the level and severity of disease. Indra reduces the impact of stress producing stronger crops that are better able to resist disease. Indra reduces incidence and severity of many fungal diseases and can be tank mixed with fungicides.

What will you see:

Indra will turn a struggling crop around. Inside a week of treatment, stress damaged crops will be greener and having new growth. It can give regrowth on tree crops that have dieback.

Used regularly, it will increase yield on crops grown in salty soil or with high EC irrigation water.
