

Micromex®

Bioaugmentation Products

The main purpose of a biological wastewater treatment plant is to break down waste organics. Micro-organisms metabolize the soluble contaminants, producing carbon dioxide, water and more micro-organisms (biomass).

The performance of a biological system is highly dependent on the microbial strains present and, in many cases, the biological population in an effluent treatment plant or lagoon is not ideally adapted to cope with variations in loading and composition and therefore unable to provide optimum performance.

OMEX® offers the Micromex EU Range, a range of bio-augmentation solutions designed to optimize the biological activity in aerobic wastewater treatment plants and lagoons, individually tailored for all types of organic-rich solids in the effluent.
